A RANGE OF SAFETY ROOF WALKWAY & ACCESS LADDER SOLUTIONS

Bike Racks

The last 3 months this newsletter has focussed on aluminium roof access and walkway systems as this is a product which we believe will be of most interest to our readership – which is primarily architects.

This month we go a bit left field with a look into Bike Racks. We are a designer of three different styles of Bike Racks – being public area bike racks, retail display bike racks, and street art bike racks.

With Cantabrians love of cycling, the opportunity for a rebuild of large parts of the CBD and city, and a general desire in the community to create a better city, we believe there is a great opportunity for bike racks in this city.....especially of the street art style.

We are gathering supporters to create innovative bike racks throughout the new Christchurch.

One of our Directors is a mad keen cyclist, both road and mountain, and has driven much of the development of these products for our company.

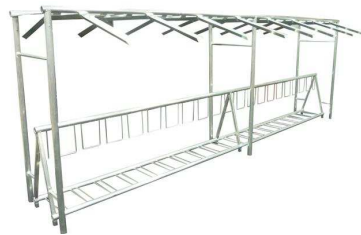

For more information including brochures on the three different types of bike racks we design and build please checkout our website by clicking on this link :

Please send us an email, a text, call us or call in to see us if you're interested in innovative bike racks.

Aluminium safety Roof Walkway & Access Systems

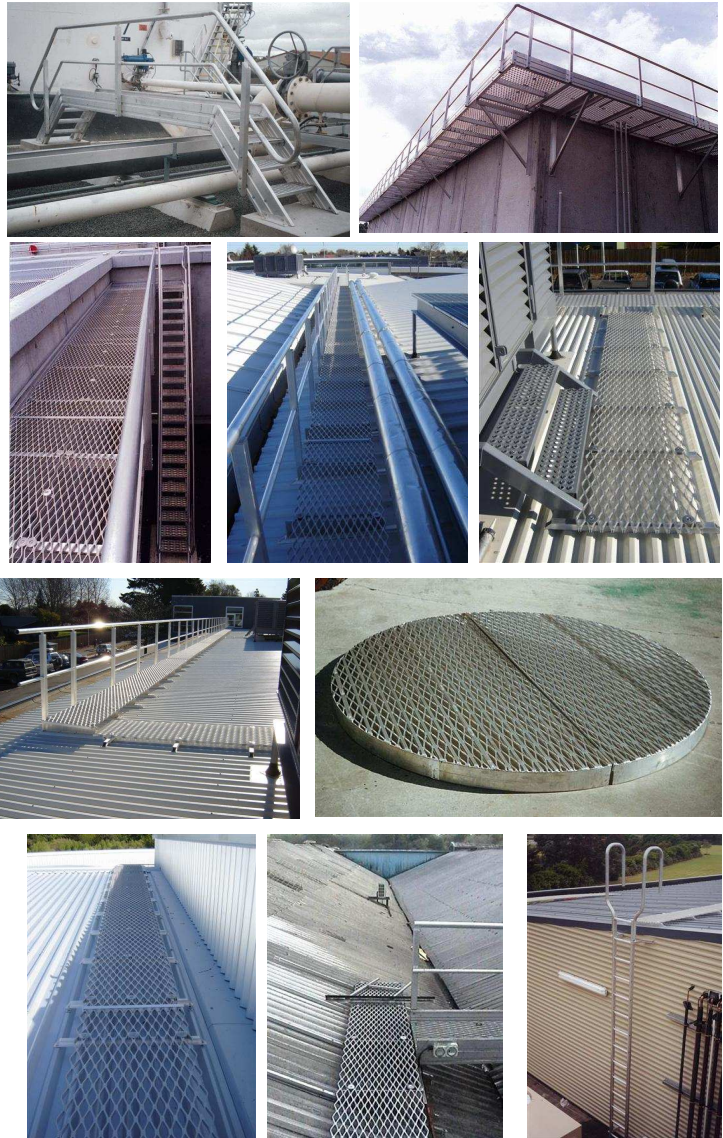

With the rebuild of Christchurch we expect that aluminium roof access walkway systems will become increasingly popular to provide safe access to roof top plant and equipment.

Aluminium roof access and walkway systems provide a lightweight yet incredibly strong and virtually maintenance-free walkway system. Non-slip and non-trip access is provided with various fixing options for a variety of pitched roof designs and materials.

Solutions typically include access ladders and stairs, walkways, handrails, and overbridges.

As an aluminium and steel fabricator, Metalcraft Eng is able to tailor-make solutions using the proprietary components from leading roof walkway and access system providers, and also our own fabricated componentry using our in-house CAD design and CNC processing equipment to provide a highly functional and bespoke solution.

All walkways and handrails are designed to meet the relevant requirements of AS1657-1992 and various statutory codes of practice.

Bryns thoughts

Although frustratingly slow for most business owners, the gradual process of the rebuild of Christchurch is happening. When I look back on where we were a few months ago the city plan was being opened for submissions, the announcements about the future of land in the city had not been announced, and everyone was uncertain. Although there is much more progress needed, at least these three basics are progressing. That can only be good for our city and its businesses.

Please include us in your next roof walkway and access solution (or bike rack!). We are innovators and good at what we do.
